

Double Gutter

Eliminate moisture intrusion with Elite's Double Gutter

Specifically designed for use with composite insulated roof panel, Elite's Double Gutter was the first design in the industry to eliminate the leaking which occurs from water build-up at the roof attachment line beneath the panel seam. By providing a secondary gutter to catch this run-off and channeling it into a reservoir below, the Elite Double Gutter safely moves all water run-off away from the house. In addition, because of its unique hinge design, the double gutter can be easily opened for cleaning, providing for access to eliminate clogging which may occur from dirt build-up.

When installed with Elite's matching fascia, the entire roof system is *capped* (both side and ends) fully protecting the core material from possible damage from ultra-violet rays, weather and insects.

- A. Beveled to bull nose edge provides and unrestricted water flow, eliminating water build-up at the attachment point with the roof.
- B. Panel stop places back wall of the primary gutter *away* from the roof panel edge, eliminating a *dam* effect should moisture penetrate through the top roof panel seam.
- C. Slight panel overhang assures total drainage into the secondary gutter of all moisture which may have penetrated the roof panel.
- D. Larger opening in the secondary gutter eliminates moisture build-up in the secondary gutter.
- E. Unique *hinge* design allows easy lowering of the secondary gutter for cleaning.

Notes:

1. The primary and secondary gutter may be attached separately
2. The Elite Double Gutter is available in White and Bronze
